

VPN Troubleshooting Guide

Authentication Failed

If the VPN client reports 'Authentication failed', verify that the corporate username is correct and that the password has not expired. If the password is expired, use the Security Portal to reset it before reconnecting.

Connection Timeout

For repeated connection timeouts, confirm that the device has internet access, restart the VPN client, and try a different approved VPN gateway if one is available.

MFA Prompt Not Received

Check that the registered authenticator device has internet connectivity and that notifications are enabled. If the prompt still does not appear, use the one-time recovery code issued by IT Support.

Escalation

If the issue continues after these steps, record the VPN client version, operating system, gateway name, and exact error message and open an IT support ticket.
